BRIEF: Computing a Local Binary Descriptor Very Fast

Castleberry, Cherry, and Firth

October 11, 2012

Motivation: A 256-Byte Descriptor?

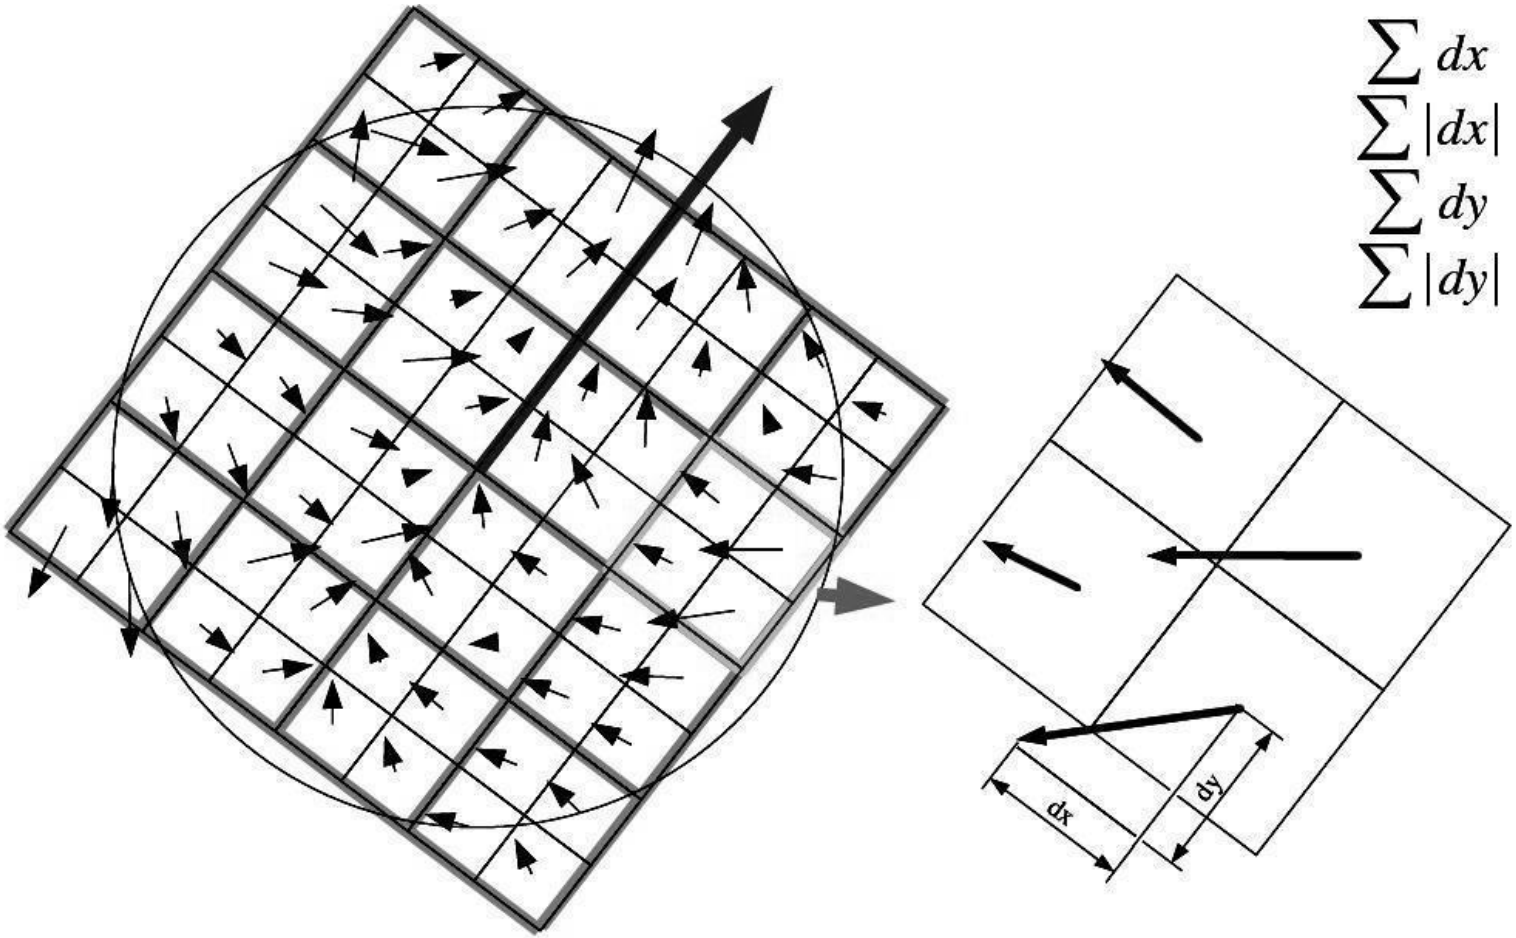

Figure : A SURF descriptor stores 64 orientation values as 4-byte integers.

Problem Definition: Make It Smaller, Compute It Faster

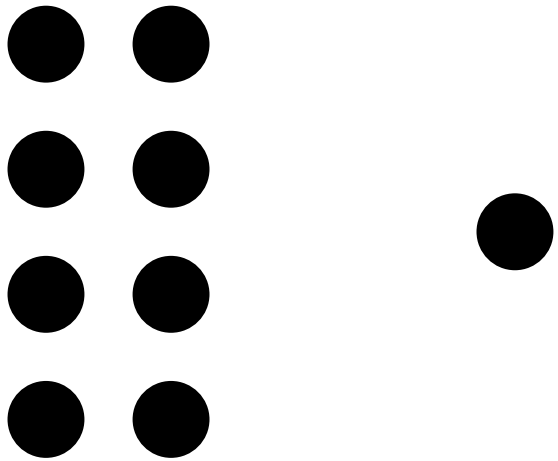

Figure : Reduce the size by a factor of 8.

Previous Work: Principal Component Analysis

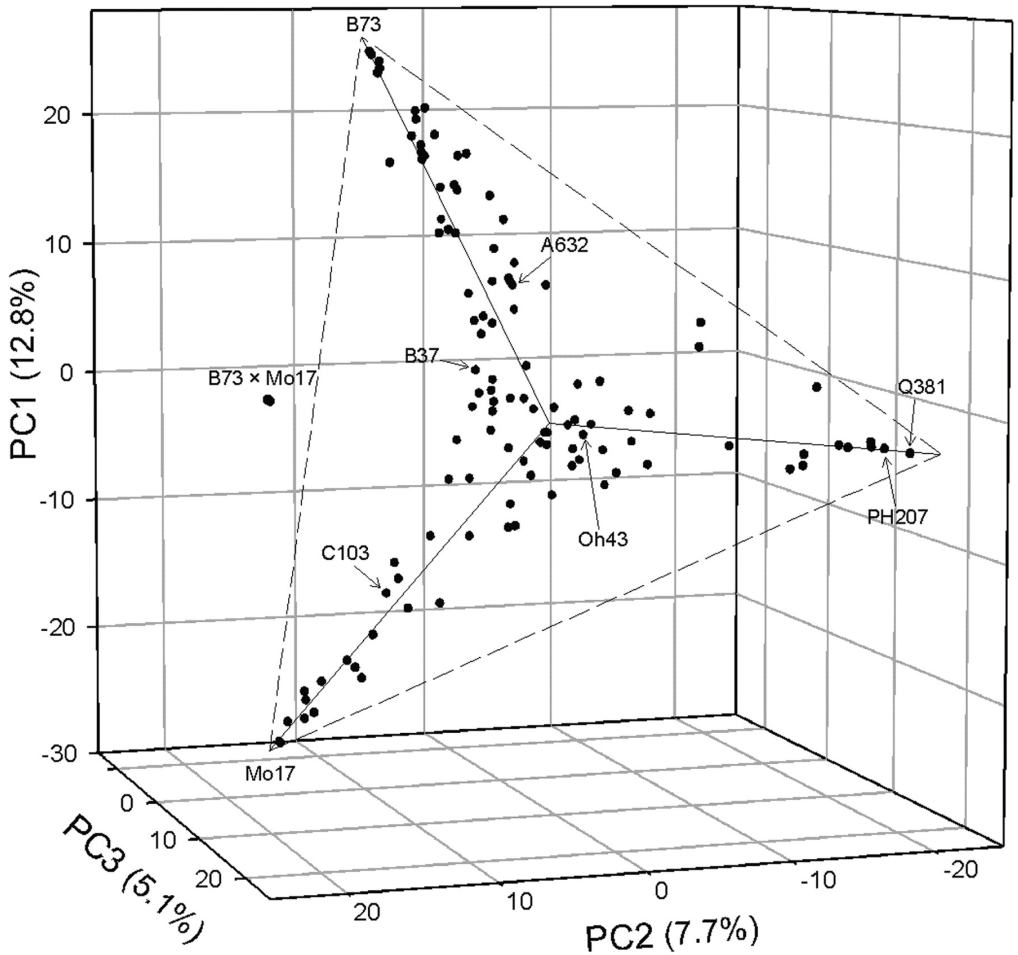

Figure : PCA with Three Components.

Previous Work: Floating-Point Quantization

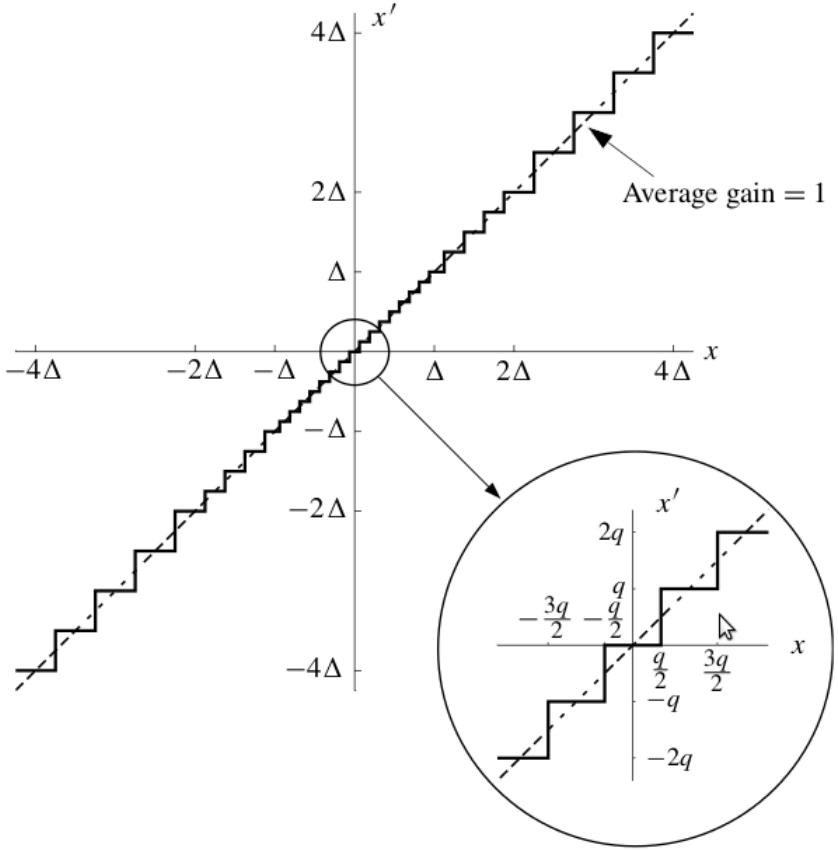

Figure : Quantization with a 3-Bit Mantissa.

Previous Work: Binarization

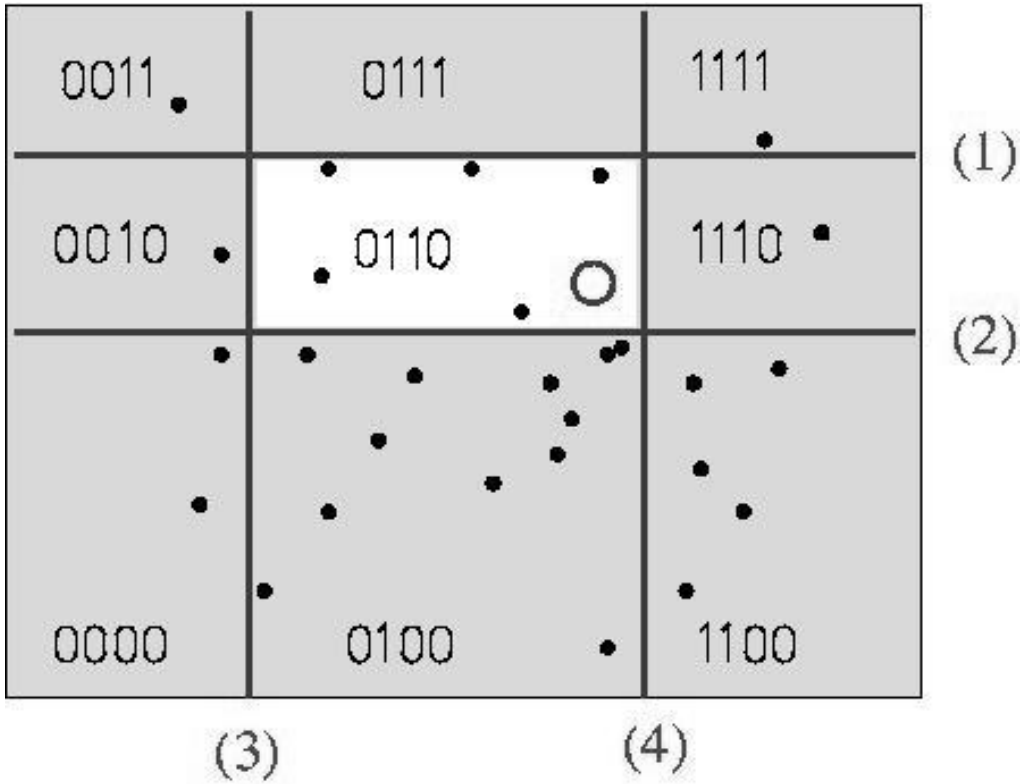

Figure : Locally Sentitive Hashing.

Method: Sampling Distributions

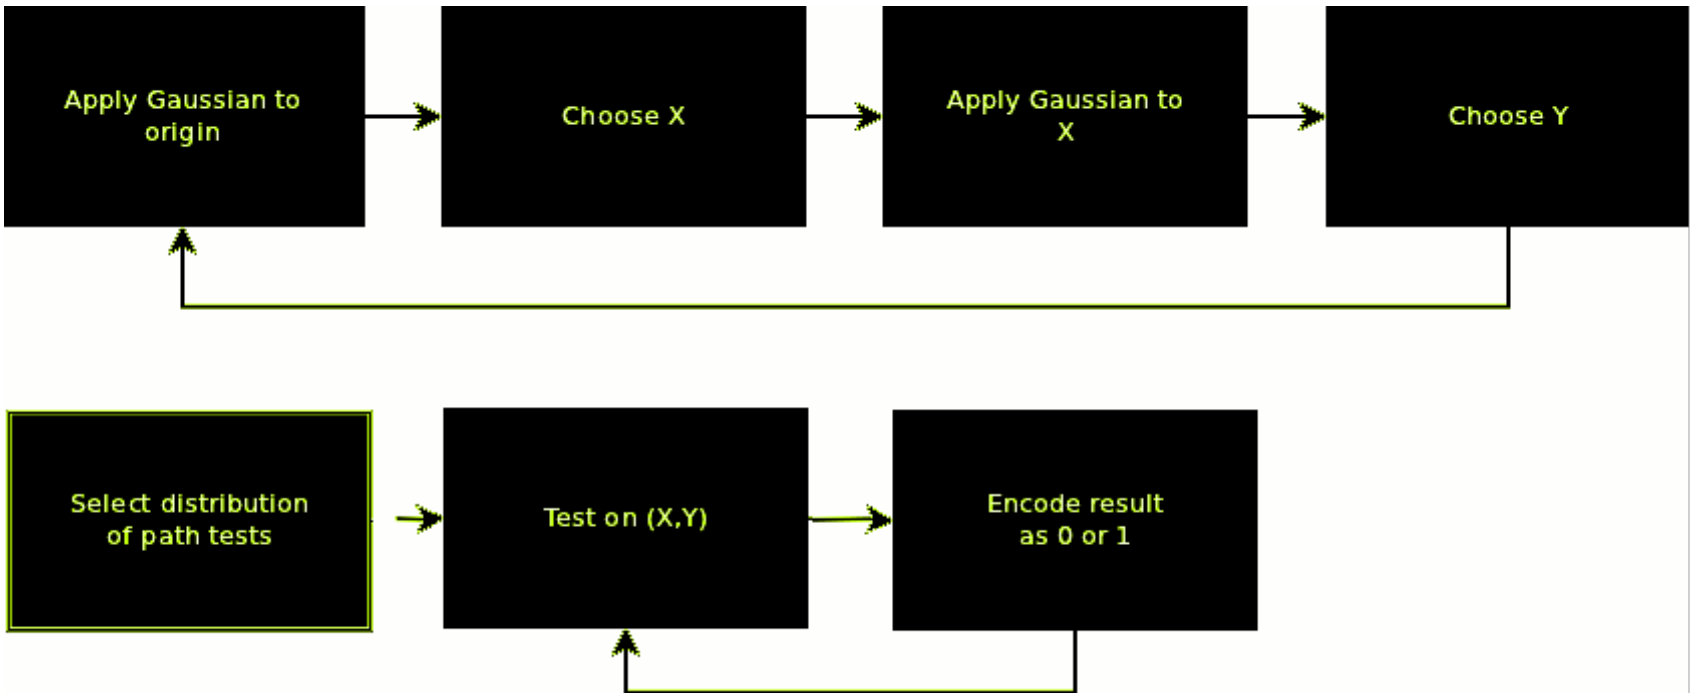

Figure : Sampling distributions.

Method: Patch Test

$$\tau(p; \mathbf{x}, y) := \begin{cases} 1 & \text{if } I(\mathbf{p}, \mathbf{x}) < I(\mathbf{p}, \mathbf{y}) \\ 0 & \text{otherwise} \end{cases} \tag{1}$$

Method: Descriptor Formula

$$\sum_{I \leq i \leq n_d} 2^{i-1} \tau(p; x_i, y_i) \tag{2}$$

Method: Hamming Distance

```
00011101
10010111
--------
10001010
```

Bit count = 3

XOR EAX, EBX
POPCNT EAX, EAX

01101011101 10010101010	10
10001110101 11000110100	3
11101110111 10101010101	?

Method: Hamming Distance

```
#include <iostream>
using namespace std;

int main(){
    int x = 5, y = 15, hamming;

    __asm{
        mov eax, x
        xor eax, y
        popcnt eax, eax
        mov hamming, eax
    };

    cout << "Hamming distance: " << hamming << endl;

    return 0;
}
```

Method: Sampling

$$\begin{array}{lll} \mathbf{X} & \leftarrow & \mathit{Gaussian}(0, \quad \frac{1}{25} \quad S^2) \\ \mathbf{Y} & \leftarrow & \mathit{Gaussian}(x, \quad \frac{1}{100} \quad S^2) \end{array} \tag{3}$$

Method: Sampling Distributions

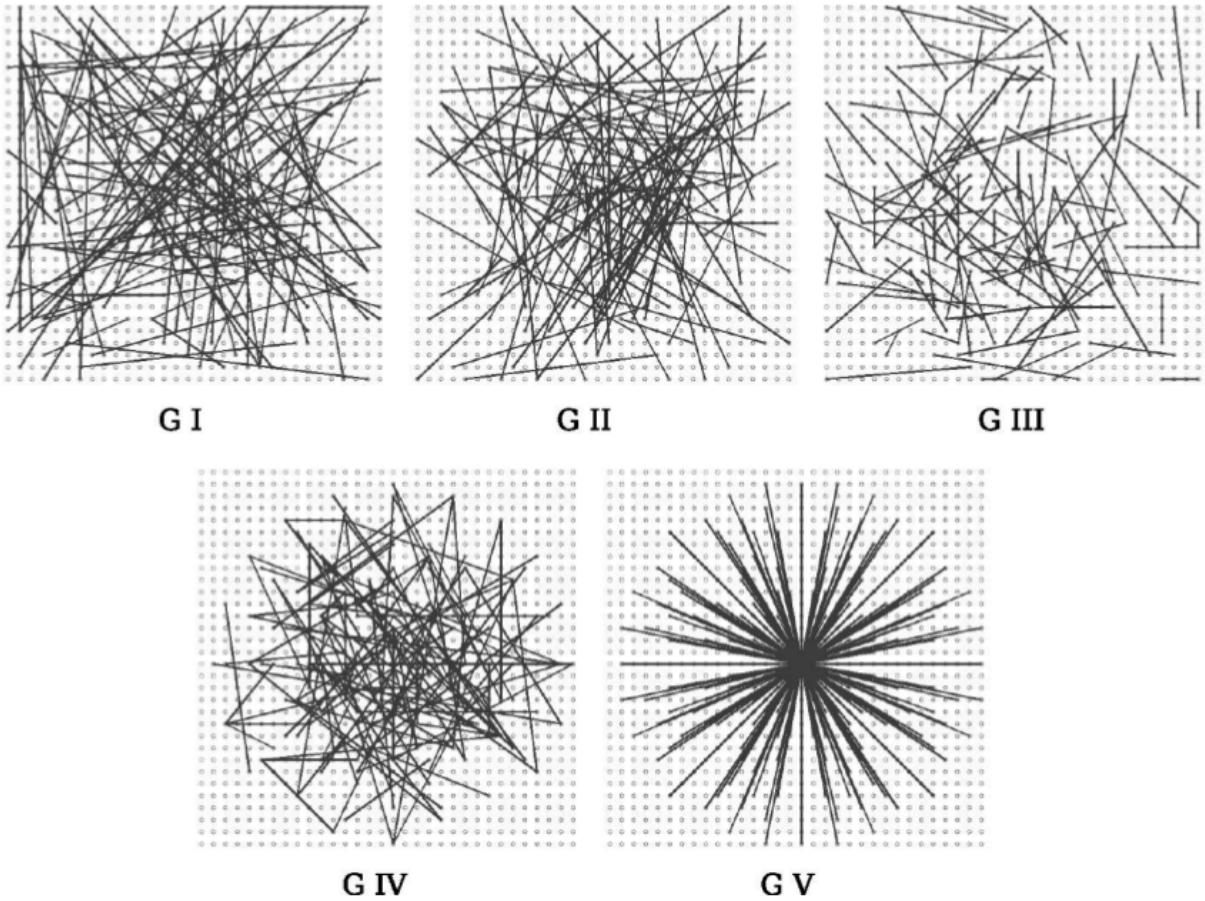

Figure : Sampling distributions.
